**"Ancient DNA: The New Frontier"
with Pamela Stagg"**

What

can we learn from Ancient DNA?

The environmental DNA that is left behind after an animal or plant has vanished lets researchers reconstruct early ecosystems. The DNA teaches us about the movement of long-extinct animals and the vanished bridges that they used to travel between continents. It can even show us how continents moved and inform us about climate change.

Pamela Stagg, the host of the radio program, *The County, Naturally*, will take you on a trip through time that simply wasn't possible even twenty years ago. Join us to learn more about our planet's history.
